

Security Awareness, Training, and Education (SATE) Programs

The right training for your organization

SAIC understands that people – not machines – wage information security wars. No amount of investment in sophisticated security technology can overcome a lack of crucial skills, awareness, or motivation among your personnel.

By developing effective SATE programs tailored to your unique environments, we can help your people secure your organization from within. SAIC uses a six-step process to build a SATE program, drawing from our experience in information security, industry best practices, and established educational principles.

Our comprehensive approach is focused on customers and their needs. We begin by understanding their environment. Then we pilot courses with subject matter experts, trainers, and knowledgeable users; provide train-the-trainer classes; and support the course-validation process.

One of our premier security training classes is a four-day System Administrator Security course that covers:

- Hacking
- Authentication
- Encryption
- Prevention and deterrence
- Viruses
- Worms
- "Denial of Service" attacks
- Auditing
- Scanning

Make the most of your training dollars and have confidence that your operation is in experienced hands. Leverage your partnership with SAIC by putting acclaimed specialists in front of your security staff.

Case study: State Government

SAIC is currently managing a state government's SATE program that includes the development and delivery of training modules in information resource planning, certification and accreditation, risk management, disaster recovery planning, and security awareness. In addition, SAIC will train all members of the state's disaster recovery planning team.

"SAIC's security program update and Rules of Behavior training were right on target. When are you coming back for the follow-on training"

– IT Security Manager
