

Technical Concept

Open Architecture

- Allows WYITT to interface with your existing communications tools
- Provides a network common operational picture (COP) and other data and services as needed for participating agencies and organizations
- Integrates into industry standard commercial off-the-shelf products
 - Visio
 - Microsoft Word
 - Excel
- Familiar interface reduces operator training time
- No license or software maintenance cost for core product

WYITT™ Built by SAIC

Emergency Response Planner

WYITT™ is an integrated suite of software tools used for network planning. These tools provide the ability to plan enhanced cross-jurisdictional and interagency voice and data networks. The software toolset will enable planners to create plans for existing or future networks as well as perform scenario-based contingency planning.

WYITT is designed to support the unique bottom-up escalating emergency response requirements for Statewide Communications Interoperability Planning (SCIP) methodology. The suite provides an optional interface to existing real-time network management software tools to provide enhanced situational awareness with a network common operational picture (COP). This interface also provides the ability to retrieve automated network discovery data from the network management system and create a plan in WYITT.

WYITT core products consists of a Network Planning Tool and Reporting Tool.

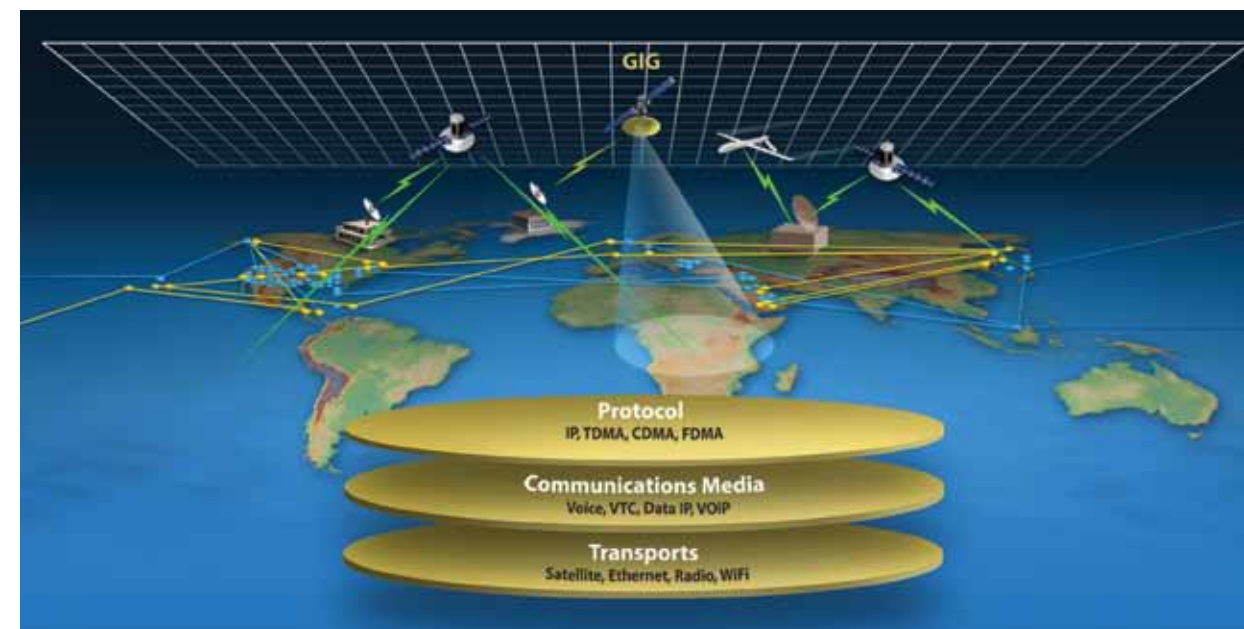

We can

- Build all customers' plans in lieu of training
- Secure network plans based on agency specific requirements

We are an experienced software development team with a proven Authority To Operate track record.

Principal Tools

- Network Planning Tool based on Visio®
- Reporting Tool application using standard Office products including Microsoft® Word and Excel®
- Network Management Tool is an optional tool outside the core product

Operational View

Key Capabilities

- Deliberate planning
- Collaboration tools to enable users to share network plans
- Contingency planning allows you to save and share plans before the event
- Generation of reporting artifacts
- Generation of management plans in XML for import into integrated network management tools

Users

- Emergency responders
- Emergency operational centers and fusion centers
- Local, state, regional, national, and forward deployed planners
- Military planners
